For Immediate Release

Equipment & Tool Tracking Software for Disaster Control Organizations

Redmond, Washington / January 11, 2011 / Dynamic Systems, Inc., a Redmond, Washington software developer specializing in data collection applications has just launched a low cost equipment & tool tracking program based on bar code technology.

About Dynamic Systems (DSI)

In business since 1981, DSI just added "Toolroom" Equipment and Tool Tracking Software to its suite of products that include: maintenance scheduling, inventory control, document tracking, capital asset manager, time and attendance, and job costing. Bar code data collection is proven to be the most accurate and efficient method of tracking / counting items.

Equipment & Tool Tracking

Toolroom is targeted for companies who need to track equipment and supplies to and from disaster sites. The software can be customized with nomenclature and photos attached. Consumable inventory is traced and alerts set for reorder points. The software will also track equipment maintenance, service, and warranties. The system is flexible enough to trace any type of item such as power, technology, furniture, etc.

Cost Justification

It only takes one minute to check a tool out or in, and if the company staff spends even 20 minutes a day searching for tools or tracking maintenance, the overhead savings is dramatic. Loss of tools and making sure all equipment is in working order are a major overhead cost that can be contained.

To learn more and experience all of the varied applications of The Checkmate Barcode Tracking Systems just visit www.a-barcode.com, or <http://www.a-barcode.com/solutions/ems-inventory-management/>.
